

BIZ2BIZIT

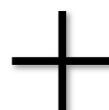

THE SMALL BUSINESS SPECIALIST

Biz2Biz IT PTY LTD
1/179 Currumburra Road
Ashmore QLD 4214

ABN 91 840 756 878

Gold Coast: 07 5597 0666
Brisbane: 07 3823 4142
Other Regions: 1300 076 243

Very slow Internet speed? Get NBN broadband speed NOW!

All you need is to get a 4G SIM card
from your Phone Services Provider, e.g.
Telstra, Optus etc)

We'll do the rest!

Use 4G (e.g. using the mobile phone network). If you can get 4G at your location, **this can provide as much as 30–40 Mbit/sec of download speed!** That is better than the projected Tier 1 (12 Mbit/sec) or Tier 2 (25 Mbit/sec) speed of the NBN - when eventually it becomes available. However, speeds may vary, depending on location etc. It is relatively inexpensive (about \$165.00 per month or so for a connection with up to 25GB of download).

Complete Package, including equipment, software subscription and on-site installation and configuration on your network

**Cyberoam Unified Threat management device, includes unlocked 4G modem.
Special offer only until 10th October 2015 with on-site installation at no charge**

**For small business (up to about 5 computers)
\$1,238.00 ex GST ; \$1,361.80 inc GST**

**For medium business (up to about 10 computers)
\$1,410.00 ex GST ; \$1,551.00 inc GST**

**For large business (up to about 30 computers)
\$1,930.00 ex GST ; \$2,123.00 inc GST**

Many other models available. Prices do not include SIM card, Dataplan and liaison with Telco.

If your ADSL (or ADSL2+) connection is unsatisfactory, you have a number of options:

1. Connect to the National Broadband Network (NBN) - but still for most areas they don't even have an expected year of implementation, not to mention a date.
2. Arrange for a **High-Speed Internet connection** (in most cases, 10 Mbit/sec up and download guaranteed): approx. \$500 - \$600 per month. Not available in all locations, depending on a number of factors. This is the ideal solution if NBN is not available.
3. **Use 4G** (e.g. using the mobile phone network). If you can get 4G at your location, **this can provide as much as 30—40 Mbit/sec of download speed!** That is better than the projected Tier 1 (12 Mbit/sec) or Tier 2 (25 Mbit/sec) speed of the NBN - when eventually it becomes available. However, speeds may vary, depending on location etc. It is relatively inexpensive (about \$165.00 per month or so for a connection with up to 25GB of download).

But it is NOT as straight forward as that!

A standard 4G modem or Hotspot, even if connected to a suitable router, will NOT provide you with all the requirements for a secure network.

Our technical team spent serious time researching this and we have found a solution. Our solution provides not just high speed Internet, but will resolve other important issues:

If your 4G connection was to fail, your Internet will automatically switch to ADSL. This will just about eliminate the potential of you being left high and dry with no Internet connection. In most cases, without browsing and email, your business simply comes to a screeching halt.

Are you concerned about what websites are surfed? Are some people wasting time on Facebook, YouTube, even downloading movies? Are you at risk of a sexual harassment complaint because a member of staff is viewing pornography in plain view of the girl at the next desk?

Solution: a 4G modem, combined with a Unified Threat Management (UTM) device

But you get much more than just higher Internet speed! This goes far beyond the standard router. It includes

- ◆ **Web Filtering:** Disable or restrict specific groups of websites (pornography, Facebook, shopping, gambling etc to be surfed. Can be user specific and restrictions can be set for specific times. **This will substantially improve productivity!**
- ◆ Automatically blocking of "bad" websites **before** they hit your network.
- ◆ Protection against Intrusions, Denial of Service Attacks and a swag of other nasties. Stop the hackers!

Why chose Biz2Biz IT?

Compare to your current IT Service provider:

1. Do they respond to emergencies in 1 hour or less?
2. Do they have other competent technicians on staff who can effectively work on your network, in case your regular technician goes on holidays or gets sick?
3. Do they allow only their own technicians to work on your network or do they subcontract to cheap labour contractors from developing countries?
4. Do you have a dedicated phone number which directly connects you to one of their technicians or are you talking to a machine?
5. Do they have your network fully documented, so any competent technician can be productive, or do they "hold the keys to the kingdom"?
6. Do they offer an on-going maintenance program to keep critical security settings and patches up-to-date?
7. Do they offer a monitoring system to watch over your network 24/7, so developing issues are detected before they become a real problem?
8. Do they proactively offer new ways to improve your network's performance, or do they wait until you have a problem to make recommendations?
